Recent Professional Experience

[ALEPE](#) | Software Engineer

Intern Management | 06/2025 - present

As the project lead and architect, we developed an intern management system that enables time tracking and vacation requests, in addition to team management by supervisors.

- Our system consumes a REST API developed in NestJS, with a robust MVC architecture based on dependency injection, ensuring easy maintenance and integration with other internal systems.
- We implemented automated tests with a strong focus on integration (end-to-end) using Jest and Supertest to validate the combined functionality of system modules and prevent regressions during new feature development.
- We developed the interface with a focus on fast loading and usability, using Next.js with Server Components and the ShadCN UI library, based on Tailwind CSS, to deliver a modern and consistent user experience.

Tags: NestJS, REST API, MVC, Dependency Injection, Migrations, TDD, Jest, Next.js, React, Tailwind CSS, TypeScript, JavaScript, Git.

Ds Logs | 07/2024 - 05/2025

We developed an AI-based solution for automated analysis of error logs in complex systems.

- Our system uses the Graylog API to import logs directly from the database, where we perform data sanitization and cleaning to ensure the information is ready for analysis.
- We integrated our AI model (Llama 3) with a network of technical documents, enabling contextualized and precise analysis. The tool performs detailed log diagnostics and offers possible solutions in real time, simplifying problem resolution.
- The system's connection to our Telegram group made it easy for the team to view the analysis at any time.
- The results of the analysis routine are stored in our own PostgreSQL database, which is integrated with Grafana for detailed and customized dashboard visualization.

Tags: Python, AI, Log, Llama 3, API, Graylog, PostgreSQL, Grafana, Telegram, Git.

Side Projects

[Curso.dev](#) | [TabNews Clone](#)

Collaborative content publishing and discussion platform in short post format.

- We developed a clone of the TabNews platform, widely used by Brazilian developers to share and discuss content related to software and technology.
- We delivered a robust REST API with an authentication and authorization system developed from scratch, using an MVC architecture to organize and scale the project.
- We adopted automated tests with Jest, TDD, and CI/CD pipelines with GitHub Actions to ensure continuous quality, prevent regressions, and maintain reliable, agile delivery.

Tags: JavaScript, Node.js, React, Next.js, PostgreSQL, Migrations, SQL, REST API, MVC Architecture, Docker, CI/CD GitHub Actions, TDD, Jest, Git/GitHub.

Social media posting tool designed to simplify content distribution across multiple platforms.

- I developed a complete application, using an MVC architecture, that integrates with several APIs (Threads, Twitter, LinkedIn) to enable cross-platform posting and used Stripe for payment processing.
- For data management, i used PostgreSQL with Prisma ORM and Supabase Storage for secure file handling.
- The interface was built with Next.js, React, Tailwind CSS, and the HeroUI component library to provide a modern and responsive user experience.

Tags: Next.js, React, Tailwind CSS, HeroUI, PostgreSQL, Prisma ORM, Supabase, Stripe, REST APIs, Threads API, Twitter API, LinkedIn API.
